This 2015 Statistics of Income (SOI) line item estimates publication provides estimates of frequencies and amounts of the entries on the lines of the forms and schedules filed with individual tax returns as shown on the 2015 Individual SOI Complete report weighted file. The estimates presented here are based on returns filed in Processing Year 2016 that were sampled statistically and then weighted to estimate the entire 2015 Tax Year.

Variations of the three basic forms, 1040, 1040A, and 1040EZ, include electronically filed returns. The form variations were categorized into the basic forms according to the data reported on the return. For example, if a return was filed electronically and its characteristics indicated that it would otherwise have been filed on paper as a 1040 or 1040A, then it was classified as such statistically.

2015 Complete Report estimates:

150,493,263	Total, all individual returns filed
85,937,245	1040 returns
40,701,100	1040A returns
23,854,918	1040EZ returns

Estimates of returns filed electronically:

131,279,367	Total, all individual returns filed
72,161,422	1040 returns
37,738,135	1040A returns
21,379,809	1040EZ returns

Limitations and Guidelines for the 2015 Line Item Estimates

Since SOI obtained the line counts used in this package from the Tax Year 2015 Individual SOI Complete Report File, they are subject to the same data limitations as the data included in the Complete Report File. These limitations are derived from the fact that these data are statistically sampled, meaning that the line counts are estimates based on samples, and should not be mistaken for actual counts of the entire filing population. While most forms and items are present often enough to provide accurate **estimates**, some less popular items **should be used with a high degree of caution**. SOI removed all line items with a sample count of fewer than 10.

The sample used in this study is one of a large number of samples that could have been selected using the same sample design. The estimates calculated from these different samples would vary. The sample estimate and an estimate of its standard error permit the construction of interval estimates with prescribed confidence that the interval includes the population value. Shown below are 95-percent confidence intervals for selected Form 1040 items. (For example, the population value of number of returns for salaries and wages, with 95-percent confidence, is between 124,317,327 and 124,865,529.) These confidence intervals correspond to the estimates for all individual income tax returns filed for Tax Year 2015.

Description of the Sample for the Line Item Estimates

This section describes the sample design and selection, the method of estimation, the sampling variability of the estimates, and the methodology of computing confidence intervals.

Domain of Study

The statistics in this report are estimates from a probability sample of unaudited Individual Income Tax Returns, Forms 1040, 1040A, and 1040EZ (including electronic returns) filed by U.S. citizens and residents during Calendar Year 2016.

All returns processed during 2016 were subjected to sampling except tentative and amended returns. Tentative returns were not subjected to sampling because the revised returns may have been sampled later, while amended returns were excluded because the original returns had already been subjected to sampling. A small percentage of returns were not identified as tentative or amended until after sampling. These returns, along with those that contained no income information or frivolous or fraudulent income information when recognized, were excluded in calculating estimates.

The estimates in this report are intended to represent all returns filed for Tax Year 2015. While most of the returns processed during Calendar Year 2016 were for Tax Year 2015, the remaining returns were mostly for prior years, and a few for non-calendar years ending during 2014 and 2015.

Sample Design and Selection

The sample design is a stratified probability sample, in which the population of tax returns is classified into subpopulations, called strata, and a sample is randomly selected independently from each stratum. Strata are defined by:

1. Nontaxable (including no alternative minimum tax) with adjusted gross income or expanded income of $200,000 or more.
2. High business receipts of $50,000,000 or more.
3. Presence or absence of special forms or schedules (Form 2555, Form 1116, Form 1040 Schedule C, and Form 1040 Schedule F).
4. Indexed positive or negative income. Sixty variables are used to derive positive and negative incomes. These positive and negative income classes are deflated using the Chain-Type Price Index for the Gross Domestic Product to represent a base year of 1991.

Tax data processed to the IRS Individual Master File at the Enterprise Computing Center at Martinsburg during Calendar Year 2015 were used to assign each taxpayer's record to the appropriate stratum and to determine whether or not the record should be included in the sample. Records are selected for the sample either if they possess certain combinations of the four ending digits of the social security number, or if their five ending digits of an eleven-digit number generated by a mathematical transformation of the SSN is less than or equal to the stratum sampling rate times 100,000.

Data Capture and Cleaning

Data capture for the SOI sample begins with the designation of a sample of administrative records. While the sample was being selected, the process was continually monitored for sample selection and data collection errors. In addition, a small subsample of returns was selected and independently reviewed, analyzed, and processed for a quality evaluation.

The administrative data and controlling information for each record designated for this sample were loaded onto an online database at the Cincinnati Submission Processing Center. Computer data for the selected administrative records were then used to identify inconsistencies, questionable values, and missing values as well as any additional variables that an editor needed to extract for each record.

After the completion of the service center review, data were further validated, tested, and balanced. Adjustments and imputations for selected fields based on prior-year data and other available information were used to make each record internally consistent. Finally, prior to publication, all statistics and tables were reviewed for accuracy and reasonableness in light of provisions of the tax law, taxpayer reporting variations and limitations, economic conditions, and comparability with other statistical series.

Some returns designated for the sample were not available for SOI processing because other areas of IRS needed the return at the same time. For Tax Year 2015, about 0.02 percent of the sample returns were unavailable.

Method of Estimation

Weights were obtained by dividing the population count of returns in a stratum by the number of sample returns for that stratum. The weights were adjusted to correct for misclassified returns and were then applied to the sample data to produce all of the estimates in this report.
